Dr. A.P.J. Abdul Kalam University, Indore, M.P.

ABSTRACT

Parental Attitudes of child development is positively associated with quality parent-child interactions and the likelihood of parents' engagement in practices that promote their children's healthy development. Research also indicates that parents with Attitudes and knowledge of evidence-based parenting practices, especially those related to promoting children's physical health and safety, are more likely than those without such knowledge to engage in those practices. Although there is currently limited empirical evidence on how parents' knowledge of available services affects uptake of those services, parenting, and child outcomes, parents Attitudes with this knowledge are likely better equipped to access services for their families.
