ABSTRACT

With a better understanding of a region's demographic structure, one may get valuable insights about the region's social, economic, and developmental trajectory. An essential case study for analysing demographic differences is Gorakhpur, a district that is characterised by a significant degree of cultural variety and strong caste stratification. The purpose of this study is to investigate what changes have occurred in Gorakhpur's population density, age composition, and gender ratio across the various caste groups. Significant variances in demographic indicators that are strongly connected to social, economic, and educational aspects are shown by the findings. These findings have larger implications for the formulation of policies, the distribution of resources, and the development of communities. In addition to making a contribution to a more nuanced understanding of social structure, this study brings to light the necessity of targeted actions in order to achieve equitable growth and gender balance across all caste groups in the location.

Keywords: Demographic, Caste, Age, Sex Ratio, Population.
