ABSTRACT

A person with good work performance and favourable organisational habits is said to have strong psychological capital. The success and happiness of people are tied to their psychological capital. It is true that people's intentions are influenced by their personalities, psychological skills, and environments. The goal of the current study is to identify gender differences among teenagers in terms of positive psychological capital (across a range of scale factors). As a result, it is possible to estimate that there may only be a gender difference in people' levels of hope and not in other aspects.

Keywords: *Mental, Gender, Personality, Capital, Psychological.*
